Builder 4.0.2 release notes

Overview

Builder 4.0.2 is a bugfix release to resolve issues with Internet Explorer & Atlassian menu-items

Notes

- Check that permission-checked user is not anonymous before using it
- Ensure that permissions= and locale= are checked
- Add %index% replacement to menulink addpage
- Ensure that manage-layouts ui respects advanced permission
- Expand the capabilities of menulink to match other page based selectors
- Add view-attachment mode to page & blogpost decorator
- Add @parentparent selector
- Avoid checking global permissions for anonymous users
- Re-instate script compression
- Fix editing of text resources
- Automatically select first link when selecting a new plugin while defining aliases
- Add tinyurl menulink
- Update CodeMirror
- Add some logging to LayoutManager
- Prevent the upload of empty resource files
- Update dashboard.wiki to pass the 'dashboard' param to recently-updated-dashboard
- Allow builder-show/hide to toggle on whether the space has a @parent or @child
- Allow layout to be defaulted based on the parent space's layout selection
- Add {blog-roll} macro
- Remove EULA
- Persuade menus to update watch & favourite icons
- Add %PARENT% css/js replacement
- Ensure that jQuery is passing spacekeys to manage-layouts action
- Move reusable content out of theme body into main decorator
- Update permission checking to pass space keys where possible
- Use contextPath when replacing layout resource urls.
- Avoid using cluster manager before it has been autowired on confluence startup
- Make builder menus compatible with atlassian jQuery enhancements (NB: Watch/Favourite links are working but the display is not updating yet)
- Fix backup tab in IE
- Add tree-view to {list-spaces}
- Notation guide updates
- Remove reflection from clustered cache abstraction layer
- Ensure all node caches are concurrent
