Convert Mail to Wiki Page

A special menulink macro location allows you to convert the currently view mail message in a Space mail archive in to a wiki page:

The resulting wiki page is fully editable and is a great way to highlight tacit knowledge stored in the mail archive.

Customise Your Space

Theme designers can now use Confluence colour schemes in their layouts allowing you to easily change colours in your space using standard Confluence functionality.

Theme layouts can be configured to allow any level of navigation and panel content customisation at space level - for example, a layout can allow you to add your own navigation in to existing menus or add your own panels to sidebars, etc. [Related tutorial...](#)

If you've been given theme design privileges, you can completely customise all aspects of the design of your space by editing an existing layout or creating a new layout based on an existing one. For more information, see [Layout Design](#).
