

Should the compound-menuitem macro display the icon for web ui links?

I'm relatively new to theme builder and I have been impressed by how easy most things can be modified. While experimenting with Theme Builder, I was trying to get the Descendant Notification Plugin to display its web ui elements on both the menu and as an icon on the page like the favorites or watch. I got the the links for both implemented without any issue, but I haven't been able to get the plugin's standard icon on either the menu or on a page. Is this possible?

I'm using Theme Builder 3.2.1
