

Body Classes

Theme Builder adds some useful classess to the HTML <body> tag that greatly simplify some otherwise complex style sheet scenarios...

The <body> tag whilst editing this page looks like this (some attributes removed for brevity):

```
<body class="atb-body layout-COMMUNITY spacekey-Builder mode-create-page context-space-pages action-createpage">
```

Here's a list of the classes used:

Class	Description	Ver
atb-body	Static class used to define the body element, always output	3.0
layout-XYZ	The ID of the layout currently being used to render the page (XYZ is replaced with the layout ID)	
spacekey-XYZ	The space in which the layout is being rendered.	3.2.1
mode-XYZ	The current mode (eg. create-page, etc) for the view context	
context-XYZ	The current context (eg. space-pages)	
action-XYZ	The current action being called, without the ".action" on the end
