

Theme Configuration 1.6.x

The theme is configured from a single configuration screen...

The details on this page are specific to **Builder 1.6.0**. If you are using **Builder 1.5.x**, please refer to [Theme Configuration 1.5.x](#).

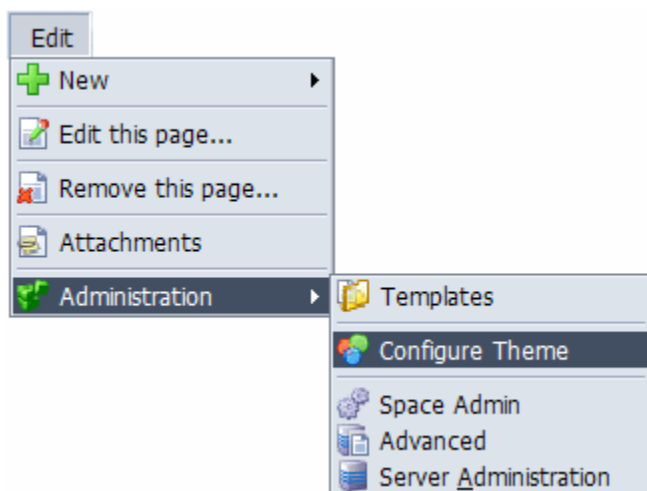

Requirements

In order to configure the theme:

- Builder must have been installed (see [Installing Builder](#))
- You must have Space Administrator privileges for the Space (or Site Administrator privileges)
- Builder must have been enabled within a Space (see [Enabling the Theme](#))

Accessing the Configuration Screen

Once the theme is in use, you can access the configuration screen at any time by choosing **Theme Config** from the **Edit > Administration** menu:

Configuration Options

The configuration screen contains the following options (from top to bottom)...

Space Home Page

This setting defines which page within a space should be used as the homepage for the space

1

and defaults to *Home*:

Space Home Page

Enter the title of the page you wish to use as this space's home page (usually "Home"). Users can access this page from the "View > Other Pages > Home" menu, as well as the breadcrumb trail and by clicking on the logo banner.

If you have set an alternate page to be the homepage for the space, simply enter the title of that page in the space provided.

1. Clicking the logo banner will also take you to the space homepage.

Menu Settings

(New in Builder 1.6!) This panel allows you to choose from the various [Menu Styles](#) and alter various [Menu Settings](#):

Menu Settings

Settings that control the appearance of the menu.
For more information and examples, please see our [online user guide](#)

Windows Longhom ▾

The overall 'look and feel' of the menus

- ☒ Show icons in the View and Edit menus
- ☒ Automatically open menus when the mouse hovers over them
- ☒ Display menu item tool tips when the mouse hovers over them
- ☒ Display shadows behind pop-up menus
- ☒ Use smooth shadows (loads an extra image file)
- ☐ Blink menu items when they are clicked
- ☐ Display menus as quickly as possible (faster page loads, inhibits use of PNG icons)
- ☐ Allow menus to be scrolled if they are too big to fit on screen

You can use these options to tailor the design and operation of the menu to your exact needs.

Should you experience any performance issues (eg. menus loading slowly), you can use these settings for [Performance Tuning](#).

Page Settings

(Upgraded in Builder 1.6!) This panel allows you to set various [Page Settings](#) that affect all pages within the space:

Page Settings

Settings that affect the look of the entire page.

750px

Page width - either as a percentage (e.g. 100%) or as pixels (e.g. 750px)

- ☒ Show the information panel, where applicable
- ☒ Enable PNG alpha-transparency support in Internet Explorer
- ☐ Remove the Dashboard link from the breadcrumb trail

Please note that if you want to use PNG icons in the menus, you must enable PNG alpha-transparency support.

Custom Menus

This panel allows you to define your own custom menus, either side of the inbuilt [View](#) and [Edit](#) menus

Custom Menus

Define your custom menus using the menu macros, wiki notation or any macros that can output unordered lists.

For more information and examples, please see our [online user guide](#)

Menu items shown before View/Edit menus:

* [Home]

Menu items shown after View/Edit menus:

To learn how to create your own custom menus, please see [Menus](#).

2. You can also customise the in-built View and Edit menus - for more information, please see our tutorial on [View and Edit Menus](#).

CSS Custom Styles

This section allows you to define style sheets to be injected in to all pages within the space:

CSS Custom Styles

Place custom CSS stylings here. This field has velocity rendering - no wiki rendering.

```
@import url(/download/attachments/918/adaptavist.css);

div.homePanel {
height: 290;
overflow: auto;
}

table.menuWrapper {
height: 26px;
}

table.tableview div.smalltext, table.tableview span.smalltext, div.tabletitle {
display: none;
visibility: false;
```

For more information on setting custom style sheets, please see our tutorial on [CSS Custom Styles](#).

Custom Footer

This section allows you to define the contents of the footer that appears at the bottom of all pages within the space:

Custom Footer

The footer appears on every page and can be specified using normal wiki notation.

```
{copyright}2006 Adaptavist.com Limited{copyright} | [Privacy Policy] | [Contact Us]
```

For more information on customising the footer, please see our tutorial on the Custom Footer.

Saving Settings

When you have finished making changes, click the **Save** button.

Some versions of Confluence do not properly back-up the theme configuration. You should always make manual copies of your theme configuration by copying and pasting the various settings in to a text document or a page within Confluence. If you copy the settings in to a page within , enclose them in the Confluence noformat macro to ensure they don't get misinterpreted as wikimarkup.
